

## Boil Water Advisory Update

Here is the current update for the Boil Water Advisory: With loss of pressure in the water system, it can create a situation where air or other microorganisms can enter the water system. Although the water system maintains a chlorine disinfectant residual that kills common water microbes, in these situations the Utility takes all precautions. The water sample was delivered to the Laboratory for testing on Thursday afternoon and the test for the bacteria requires 3 to 5 days to determine that there is no contaminates.

We will update you again when results are received.

Thank you for patience,

Shelter Bay Office
